

第一章 极限与连续

1.1 极限与连续练习

习题 1.1.1. 求极限 $\lim_{x \rightarrow \frac{\pi}{4}} (\tan x)^{\frac{1}{\cos x - \sin x}}$

解. $\lim_{x \rightarrow \frac{\pi}{4}} (\tan x)^{\frac{1}{\cos x - \sin x}} = e^{\lim_{x \rightarrow \frac{\pi}{4}} \frac{\ln(\tan x)}{\cos x - \sin x}} = e^{\lim_{x \rightarrow \frac{\pi}{4}} \frac{1}{\cos x} \cdot \frac{\tan x - 1}{1 - \tan x}} = e^{-\sqrt{2}}$ □

习题 1.1.2. 求极限 $\lim_{x \rightarrow 0} \frac{(x - \sin x)e^{-x^2}}{\sqrt{1 - x^3} - 1}$

解. $\lim_{x \rightarrow 0} \frac{(x - \sin x)e^{-x^2}}{\sqrt{1 - x^3} - 1} = \lim_{x \rightarrow 0} \frac{\frac{1}{6}x^3}{-\frac{1}{2}x^3} = -\frac{1}{3}$ □

习题 1.1.3. 求极限 $\lim_{n \rightarrow \infty} [(n+1)^\alpha - n^\alpha]$

解. $\lim_{n \rightarrow \infty} [(n+1)^\alpha - n^\alpha] = \lim_{n \rightarrow \infty} n^\alpha \left[\left(1 + \frac{1}{n}\right)^\alpha - 1 \right] = \lim_{n \rightarrow \infty} \alpha n^{\alpha-1} = \begin{cases} 0, & \alpha < 1 \\ \alpha, & \alpha = 1 \\ +\infty, & \alpha > 1 \end{cases}$ □

习题 1.1.4. 求极限 $\lim_{x \rightarrow 0} \frac{\ln(1 + x^2 - x^2)}{\sin^4 x}$

解. $\lim_{x \rightarrow 0} \frac{\ln(1 + x^2 - x^2)}{\sin^4 x} = \lim_{x \rightarrow 0} \frac{x^2 + \frac{1}{2}x^4 + o(x^4) - x^2}{x^4} = \frac{1}{2}$ □

习题 1.1.5. 已知 $f(1) = 0, f'(1)$ 存在, 求 $I = \lim_{x \rightarrow 0} \frac{f(\sin^2 x + \cos x)}{(e^{x^2} - 1) \sin x}$

解.

$$\begin{aligned} I &= \lim_{x \rightarrow 0} \frac{3xf(\sin^2 x + \cos x)}{x^3} = \lim_{x \rightarrow 0} 3 \frac{f(\sin^2 x + \cos x) - f(1)}{\sin^2 x + \cos x - 1} \cdot \frac{\sin^2 x + \cos x - 1}{x^2} \\ &= 3f'(1) \cdot \frac{1}{2} = \frac{3}{2}f'(1) \end{aligned}$$

□

习题 1.1.6. 设 $f(0) \neq 0, f(x)$ 连续, 求 $I = \lim_{x \rightarrow 0} \frac{2 \int_0^x (x-t)f(t)dt}{x \int_0^x f(x-t)dt}$

解.

$$\begin{aligned} I &= \lim_{x \rightarrow 0} 2 \frac{x \int_0^x f(t)dt - \int_0^x tf(t)dt}{x \int_0^x f(t)dt} = 2 - 2 \lim_{x \rightarrow 0} \frac{\int_0^x tf(t)dt}{x \int_0^x f(t)dt} \\ &\stackrel{\frac{0}{0}}{=} 2 - 2 \lim_{x \rightarrow 0} \frac{xf(x)}{x^2 f(x) + \int_0^x f(t)dt} \end{aligned}$$

由积分中值定理可得

$$I = 2 - 2 \lim_{\substack{x \rightarrow 0 \\ 0 < |\xi| < |x|}} \frac{xf(x)}{xf(x) + xf(\xi)}$$

即

$$I = 2 - 2 \times \frac{f(0)}{2f(0)} = 1$$

□

习题 1.1.7. 研究 $y = \frac{x^3}{x^2 + 2x - 3}$ 的渐进线

解. 分母 $x^2 + 2x - 3 \neq 0 \Rightarrow (x+3)(x-1) \neq 0 \Rightarrow$ 定义域为 $\mathbb{R} \setminus \{-3, 1\}$

当 $x \rightarrow \pm\infty$ 时, $y = \frac{x^3}{x^2 + 2x - 3} \sim x$, 斜渐进线的斜率 $k = \lim_{x \rightarrow \infty} \frac{y}{x} = 1$

截距 $b = \lim_{x \rightarrow \infty} (y - kx) = \lim_{x \rightarrow \infty} \frac{x^3}{x^2 + 2x - 3} - x = \lim_{x \rightarrow \infty} \frac{-2x^2 + 3x}{x^2 + 2x - 3} = -2$

故有斜渐进线 $y = x - 2$

当 $x \rightarrow 1$ 时, $y = \frac{x^3}{x^2 + 2x - 3} \sim \frac{1}{x-1}$, 故有垂直渐进线 $x = 1$

当 $x \rightarrow -3$ 时, $y = \frac{x^3}{x^2 + 2x - 3} \sim -\frac{9}{2(x+3)}$, 故有垂直渐进线 $x = -3$

□

习题 1.1.8. 设 $x_1 > 0, x_{n+1} = \frac{1}{2} \left(x_n + \frac{1}{x_n} \right), n \in \mathbb{N}^+$, 求 $\lim_{n \rightarrow \infty} x_n$

解. 由 $x_1 > 0$, 可得 $x_{n+1} > 0 \Rightarrow x_n = \frac{1}{2} \left(x_{n-1} + \frac{1}{x_{n-1}} \right) \geq \frac{1}{2} \left(2\sqrt{x_{n-1} \cdot \frac{1}{x_{n-1}}} \right) = 1, n \geq$

2

又 $\frac{x_{n+1}}{x_n} = \frac{1}{2} \left(1 + \frac{1}{x_n^2} \right) \leq 1 \Rightarrow \{x_n\}$ 单调递减且有下界 1, 故 $\{x_n\}$ 收敛, 设 $\lim_{n \rightarrow \infty} x_n = a$

则 $a = \frac{1}{2} \left(a + \frac{1}{a} \right) \Rightarrow a = 1$, 故 $\lim_{n \rightarrow \infty} x_n = 1$. $\square$

习题 1.1.9. 求极限 $\lim_{n \rightarrow \infty} \left(\frac{1}{n+1} + \frac{1}{n+2} + \cdots + \frac{1}{n+n} \right)$

解. $\lim_{n \rightarrow \infty} \left(\frac{1}{n+1} + \frac{1}{n+2} + \cdots + \frac{1}{n+n} \right) = \lim_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n \frac{1}{1 + \frac{k}{n}} = \int_0^1 \frac{1}{1+x} dx = \ln 2$ $\square$

习题 1.1.10. 求极限 $\lim_{x \rightarrow \infty} \left(x^{\frac{1}{x}} - 1 \right)^{\frac{1}{\ln x}}$

解. $\lim_{x \rightarrow \infty} \left(x^{\frac{1}{x}} - 1 \right)^{\frac{1}{\ln x}} = e^{\lim_{x \rightarrow \infty} \frac{\ln \left(x^{\frac{1}{x}} - 1 \right)}{\ln x}} = e^{\lim_{x \rightarrow \infty} \frac{x^{\frac{1}{x}} \left(-\frac{1}{x^2} \ln x + \frac{1}{x^2} \right)}{\frac{1}{x} \left(x^{\frac{1}{x}} - 1 \right)}}$

$= e^{\lim_{x \rightarrow \infty} \frac{1 - \ln x}{x \left(e^{\frac{1}{x} \ln x} - 1 \right)}} = e^{\lim_{x \rightarrow \infty} \frac{1 - \ln x}{\ln x}} = e^{-1}$ $\square$

习题 1.1.11. 求极限 $\lim_{x \rightarrow 0} \frac{\sin(\ln(1+x)) - \ln(1+\sin x)}{(\sqrt{1+x^2} - 1) \tan x}$

解. 记 $I = \lim_{x \rightarrow 0} \frac{\sin(\ln(1+x)) - \ln(1+\sin x)}{(\sqrt{1+x^2} - 1) \tan x}$, 则

$$\begin{aligned} I &= \lim_{x \rightarrow 0} \frac{\sin(\ln(1+x)) - \ln(1+x) + \ln(1+x) - \ln(1+\sin x)}{\left(\frac{1}{2} x^3 \right)} \\ &= 2 \lim_{x \rightarrow 0} \frac{\sin(\ln(1+x)) - \ln(1+x)}{x^3} + 2 \lim_{x \rightarrow 0} \frac{\ln(1+x) - \ln(1+\sin x)}{x^3} \end{aligned}$$

由拉格朗日中值定理可得

$$\ln(1+x) - \ln(1+\sin x) = \frac{x - \sin x}{1 + \xi}, |\sin x| < |\xi| < |x|$$

故

$$I = 2 \lim_{x \rightarrow 0} \frac{-\frac{1}{6} \ln^3(1+x)}{x^3} + 2 \lim_{\substack{x \rightarrow 0 \\ |\sin x| < |\xi| < |x|}} \frac{(x - \sin x) \frac{1}{1 + \xi}}{x^3} = 2 \times \left(-\frac{1}{6} \right) + 2 \times \frac{1}{6} = 0$$

$\square$

习题 1.1.12. 求极限 $I = \lim_{x \rightarrow \infty} \frac{\pi \int_0^x t |\sin t| dt}{2x^2}$

解. $n\pi \leq x < (n+1)\pi, n \in \mathbb{Z}$ 时, 有 $\int_0^{n\pi} t |\sin t| dt = \sum_{k=0}^{n-1} \int_{k\pi}^{(k+1)\pi} (-1)^k \cdot t |\sin t| dt$

其中 $\int_{k\pi}^{(k+1)\pi} t \sin t dt = (-t \cos t + \sin t) \Big|_{k\pi}^{(k+1)\pi} = (-1)^k \cdot \pi(2k+1)$

于是 $\int_0^{n\pi} t |\sin t| dt = \pi \sum_{k=0}^{n-1} (2k+1) = n^2 \pi$, 故显然有 $\frac{n^2}{2(n+1)^2} \leq I \leq \frac{(n+1)^2}{2n^2}$

由夹逼定理易得 $I = \frac{1}{2}$ □

习题 1.1.13. 求极限 $\lim_{x \rightarrow 0} \left(\frac{x}{(e^x - 1)\sqrt{1-x}} \right)^{\frac{1}{\ln(x + \sqrt{1-x})}}$

解. 由于 $\lim_{x \rightarrow 0} \frac{\ln(x + \sqrt{1+x^2})}{x} = 1 + \lim_{x \rightarrow 0} \frac{\sqrt{1+x^2} - 1}{x} = 1$, 故

$$\begin{aligned} \text{原式} &= e^{\lim_{x \rightarrow 0} \frac{1}{\ln(x + \sqrt{1+x^2})} \ln \frac{x}{(e^x - 1)\sqrt{1-x}}} = e^{\lim_{x \rightarrow 0} \frac{1}{x} \cdot \frac{x - (e^x - 1)\sqrt{1-x}}{(e^x - 1)\sqrt{1-x}}} \\ &= e^{\lim_{x \rightarrow 0} \frac{x - (x + \frac{1}{2}x^2 + o(x^3))(1 - \frac{1}{2}x + o(x))}{x}} = e^{\lim_{x \rightarrow 0} \frac{1}{x^2} \left[x - \left(x + \frac{x^2}{2} - \frac{x^2}{2} - \frac{x^3}{3} + o(x^2) \right) \right]} \\ &= 1 \end{aligned} \quad \square$$

习题 1.1.14. 设函数 $f(x)$ 在 $x=0$ 附近有界, 且满足方程 $f(x) - \frac{1}{2}f\left(\frac{x}{2}\right) = x^2$, 求 $f(x)$

解.

$$\begin{aligned} f(x) - \frac{1}{2}f\left(\frac{x}{2}\right) &= x^2 \\ \frac{1}{2}f\left(\frac{x}{2}\right) - \frac{1}{2^2}f\left(\frac{x}{2^2}\right) &= \frac{1}{2}\left(\frac{x}{2}\right)^2 \\ \frac{1}{2^2}f\left(\frac{x}{2^2}\right) - \frac{1}{2^3}f\left(\frac{x}{2^3}\right) &= \frac{1}{2^2}\left(\frac{x}{2^2}\right)^2, \dots \\ \frac{1}{2^{n-1}}f\left(\frac{x}{2^{n-1}}\right) - \frac{1}{2^n}f\left(\frac{x}{2^n}\right) &= \frac{1}{2^{n-1}}\left(\frac{x}{2^{n-1}}\right)^2 \end{aligned}$$

将上面 n 个等式相加, 得

$$f(x) - \frac{1}{2^n}f\left(\frac{x}{2^n}\right) = x^2 \sum_{k=0}^{n-1} \frac{1}{2^k \cdot 4^k} = x^2 \cdot \frac{1 - \left(\frac{1}{8}\right)^n}{1 - \frac{1}{8}} = \frac{8}{7}x^2 \left[1 - \left(\frac{1}{8}\right)^n \right]$$

由于 $f(x)$ 在 $x=0$ 附近有界, 令 $n \rightarrow \infty$, 得 $f(x) = \frac{8}{7}x^2$ □

习题 1.1.15. 设 $\sum_{k=1}^n a_k = 0$, 求 $\lim_{x \rightarrow +\infty} \sum_{k=1}^n a_k \sqrt{k+x}$

解. 法一: 由于 $\sqrt{k+x} = \sqrt{x} \sqrt{1 + \frac{k}{x}} = \sqrt{x} \left(1 + \frac{k}{2x} + o\left(\frac{1}{x}\right) \right)$, 故

$$\begin{aligned} \lim_{x \rightarrow +\infty} \sum_{k=1}^n a_k \sqrt{k+x} &= \lim_{x \rightarrow +\infty} \sqrt{x} \sum_{k=1}^n a_k \left(1 + \frac{k}{2x} + o\left(\frac{1}{x}\right) \right) \\ &= \lim_{x \rightarrow +\infty} \sqrt{x} \left(\sum_{k=1}^n a_k + \frac{1}{2x} \sum_{k=1}^n k a_k + o\left(\frac{1}{x}\right) \right) \\ &= \lim_{x \rightarrow +\infty} \sqrt{x} \cdot \frac{1}{2x} \sum_{k=1}^n k a_k + \lim_{x \rightarrow +\infty} \sqrt{x} \cdot o\left(\frac{1}{x}\right) \\ &= 0 \end{aligned}$$

法二: 注意到在 $x > 0$ 时, $\sum_{k=1}^n a_k \sqrt{x} = 0$, 于是

$$\lim_{x \rightarrow +\infty} \sum_{k=1}^n a_k \sqrt{k+x} = \lim_{x \rightarrow +\infty} \sum_{k=1}^n (a_k \sqrt{k+x} - a_k \sqrt{x}) = \lim_{x \rightarrow +\infty} \sum_{k=1}^n \frac{a_k k}{\sqrt{k+x} + \sqrt{x}} = 0$$

□

习题 1.1.16. 求极限 $\lim_{n \rightarrow \infty} \prod_{k=1}^n \left(1 + \frac{k}{n^2} \right)$

解. 记 $x_n = \prod_{k=1}^n \left(1 + \frac{k}{n^2} \right)$, 则 $\lim_{n \rightarrow \infty} \ln x_n = \lim_{n \rightarrow \infty} \sum_{k=1}^n \ln \left(1 + \frac{k}{n^2} \right)$

当 $x > 0$ 时, $x - \frac{x^2}{2} \leq \ln(1+x) \leq x$, 故

$$\begin{aligned} \lim_{n \rightarrow \infty} \sum_{k=1}^n \left(\frac{k}{n^2} - \frac{k^2}{2n^4} \right) &\leq \lim_{n \rightarrow \infty} \sum_{k=1}^n \ln \left(1 + \frac{k}{n^2} \right) \leq \lim_{n \rightarrow \infty} \sum_{k=1}^n \frac{k}{n^2} \\ \lim_{n \rightarrow \infty} \left(\frac{n(n+1)}{2n^2} - \frac{n(n+1)(2n+1)}{12n^4} \right) &\leq \lim_{n \rightarrow \infty} \sum_{k=1}^n \ln \left(1 + \frac{k}{n^2} \right) \leq \lim_{n \rightarrow \infty} \frac{n(n+1)}{2n^2} \\ \frac{1}{2} &\leq \lim_{n \rightarrow \infty} \sum_{k=1}^n \ln \left(1 + \frac{k}{n^2} \right) \leq \frac{1}{2} \end{aligned}$$

由夹逼定理可得 $\lim_{n \rightarrow \infty} \ln x_n = \frac{1}{2}$, 即 $\lim_{n \rightarrow \infty} x_n = e^{\frac{1}{2}}$

□

习题 1.1.17. 设 $f(x)$ 在 $[0, 1]$ 上连续, 且 $f(0) = f(1)$, 求证: $\forall n \in \mathbb{N}^+, \exists x \in [0, 1]$, 使得 $f(x) = f\left(x + \frac{1}{n}\right)$

证明. 令 $h(x) = f\left(x + \frac{1}{n}\right) - f(x)$

$$h(0) = f\left(\frac{1}{n}\right) - f(0), \quad h\left(\frac{1}{n}\right) = f\left(\frac{2}{n}\right) - f\left(\frac{1}{n}\right), \quad \dots, \quad h\left(\frac{n-1}{n}\right) = f(1) - f\left(\frac{n-1}{n}\right)$$

$$\text{则 } \sum_{k=0}^{n-1} h\left(\frac{k}{n}\right) = f(1) - f(0) = 0$$

另一方面, $nm \leq \sum_{k=0}^{n-1} h\left(\frac{k}{n}\right) \leq M \Rightarrow nm \leq \frac{1}{n} \sum_{k=0}^{n-1} h\left(\frac{k}{n}\right) \leq M$, 故由闭区间上连续函数介值

定理知 $\exists x \in [0, 1]$, 使得 $h(x) = 0$, 即 $f(x) = f\left(x + \frac{1}{n}\right)$ □

习题 1.1.18. 求极限 $\lim_{x \rightarrow +\infty} \sqrt{x} \int_x^{x+1} \frac{1}{\sqrt{t + \sin t + x}} dt$

解. 当 x 足够大时, 有

$$\begin{aligned} \int_x^{x+1} \frac{1}{\sqrt{t + \sin t + x}} dt &\leq \int_x^{x+1} \frac{1}{\sqrt{x-1+x}} dt = \frac{1}{\sqrt{2x-1}} \\ \int_x^{x+1} \frac{1}{\sqrt{t + \sin t + x}} dt &\geq \int_x^{x+1} \frac{1}{\sqrt{x+1+1+x}} dt = \frac{1}{\sqrt{2x+2}} \end{aligned}$$

因为

$$\lim_{x \rightarrow +\infty} \sqrt{x} \cdot \frac{1}{\sqrt{2x+2}} = \frac{1}{\sqrt{2}}, \quad \lim_{x \rightarrow +\infty} \sqrt{x} \cdot \frac{1}{\sqrt{2x-1}} = \frac{1}{\sqrt{2}}$$

故由夹逼定理可得

$$\lim_{x \rightarrow +\infty} \sqrt{x} \int_x^{x+1} \frac{1}{\sqrt{t + \sin t + x}} dt = \frac{1}{\sqrt{2}}$$

□

注. 遇到无穷与三角函数结合的极限时, 应当考虑利用三角函数的有界性进行夹逼。

习题 1.1.19. 若 $f''(x)$ 不变号, 且曲线 $y = f(x)$ 在点 $(1, 1)$ 处的曲率圆为 $x^2 + y^2 = 2$, 则函数 $f(x)$ 在区间 $(1, 2)$ 内 ()

A. 有极值点, 无零点 B. 无极值点, 有零点 C. 有极值点, 有零点 D. 无极值点, 无零点

解. 曲率圆心和 $(1, 1)$ 的连线与该点切线垂直, 故 $f'(1) = -1$, 且曲率中心在曲线的凹侧, 故 $f''(1) < 0$, 又 $f''(x)$ 不变号, 故 $f''(x) < 0$, 故 $f'(x)$ 单调递减, 且 $f'(x) < f'(1) = -1 < 0$, 故 $f(x)$ 在 $(1, 2)$ 内无极值点, 对 $f(x)$ 在点 $(1, 1)$ 泰勒展开得

$$f(x) = 1 - (x-1) + \frac{f''(\xi)}{2}(x-1)^2 < 2 - x, \quad \xi \in (1, x)$$

故 $f(2) < 0$, 由介值定理知 $f(x)$ 在 $(1, 2)$ 内有零点, 故选 B。

□

习题 1.1.20. 设函数 $f(x)$ 在 $[a, b]$ 上连续且单调递增, $I_1 = \int_a^b xf(x) dx$, $I_2 = \frac{a+b}{2} \int_a^b f(x) dx$, 则 ()

A. $I_1 > I_2$ B. $I_1 < I_2$ C. $I_1 = I_2$

D. 无法比较

解. 设辅助函数 $F(x) = \int_a^x f(t) dt - \frac{a+x}{2} \int_a^x f(x) dx$, 则

$$\begin{aligned} F'(x) &= xf(x) - \frac{1}{2} \int_a^x f(t) dt - \frac{a+x}{2} f(x) = \frac{1}{2} \left[(x-a)f(x) - \int_a^x f(t) dt \right] \\ &= \frac{1}{2} \int_a^x [f(x) - f(t)] dt \geq 0 \end{aligned}$$

故 $F(x)$ 在 $[a, b]$ 上单调递增, 且 $F(a) = 0$, 故 $F(b) > 0$, 即 $I_1 > I_2$, 选 A。

□
